

DaemonCore FieldOps Commercial Brief

Licensed assessment operations for consultants and security teams

DOCUMENT	RELEASE	STATUS	PUBLISHED
DC-DOC-900-D	9.0.0	Official	14 September 2026

Intended audience Security leadership, consulting practices, procurement, and technical evaluators

FieldOps is the separately licensed assessment workspace in DaemonCore Academy. It connects authorization, exact-scope execution, evidence, findings, retesting, resilience validation, and client-ready reporting in one local-first operating record.

Operational value

FieldOps is designed for teams that need continuity between why an assessment was authorized, what was executed, what the system returned, how the condition was interpreted, and whether remediation held. It complements specialist tools by retaining their outputs inside an accountable engagement record.

Operational layer	FieldOps capability
Authority	Named operator, approver, window, targets, ports, and signed permit
Execution	Managed diagnostics, campaigns, web and API requests, TLS review, and supported adapters
Evidence	Sealed captures, imports, digests, activity ledger, and case exports
Findings	Severity, evidence links, remediation, retest, and closure lifecycle
Reporting	Campaign summary, inventory, surface change, and reviewed findings

Managed technical coverage

The installed environment determines actual adapter availability. FieldOps reports whether an integration is ready, unavailable, native, or Docker-backed rather than claiming every tool is present.

Area	Supported workflow
Network and services	Nmap discovery and service inventory against exact approved targets
Web and API	Request composer, OpenAPI import, redacted history, passive ZAP baseline
Vulnerability intelligence	Nuclei JSONL normalization through managed adapters
TLS	testssl.sh protocol, certificate, cipher, and posture evidence
Resilience	Managed k6 profiles bounded by target-hosted capacity verification
Evidence intake	JSON and SARIF import with integrity and scope context

Deployment and data

The desktop application is local-first. Customer-controlled workstations and Docker perform assessment execution. Operator records remain in the application data directory unless exported. License secrets and signing keys use operating-system protected storage when available.

FieldOps is delivered inside the Windows and Linux DaemonCore Academy application and remains paywalled through Lemon Squeezy licensing. Academy learning content remains available without a FieldOps purchase.

Buyer fit

Best fit	Evaluate carefully when
Consultancies needing repeatable evidence and reports	A team requires a cloud multi-tenant management plane today
Internal security validation and remediation teams	The primary need is a single specialist scanner only
Operators coordinating several supported tools	Required adapters are unavailable in the deployment environment
Teams that value local-first records	Centralized real-time collaboration is mandatory

Evaluation checklist

Before purchase, confirm the operating system, Docker availability, required adapters, license terms, reporting needs, data-retention expectations, and the organization's authorization process. Run a controlled pilot against owned infrastructure and judge the evidence workflow, not screenshots or marketing language alone.

Document control

This document describes DaemonCore Academy 9.0.0. When application behavior and this guide differ, stop the affected workflow and consult the release notes or support channel before continuing. Product and framework names belonging to third parties are used descriptively and do not imply endorsement.

Field	Value
Owner	DaemonCore Apps
Release	9.0.0
Classification	Public product documentation
Review trigger	Material product, policy, or credential-status change
